### Description:

A vigorous sedge that can grow in very diverse habitats; great in full sun or under the shade of large trees; suitable for rock gardens or as a groundcover but must have sufficient water

### Ornamental Features

Blue Sedge is primarily valued in the garden for its interestingly mounded form. Its attractive grassy leaves remain steel blue in color throughout the year.

### Landscape Attributes

Blue Sedge is a dense herbaceous evergreen perennial grass with a mounded form. It brings an extremely fine and delicate texture to the garden composition and should be used to full effect.

This is a relatively low maintenance plant, and is best cleaned up in early spring before it resumes active growth for the season. It has no significant negative characteristics.

Blue Sedge is recommended for the following landscape applications;

- Mass Planting
- Border Edging
- General Garden Use
- Groundcover

### Planting & Growing

Blue Sedge will grow to be about 8 inches tall at maturity, with a spread of 12 inches. Its foliage tends to remain low and dense right to the ground. It grows at a slow rate, and under ideal conditions can be expected to live for approximately 10 years. As an evergreen perennial, this plant will typically keep its form and foliage year-round.

This plant does best in partial shade to full shade. Keep it well away from hot, dry locations that receive direct afternoon sun or which get reflected sunlight, such as against the south side of a white wall. It is quite adaptable, preferring to grow in average to wet conditions, and will even tolerate some standing water. It may require supplemental watering during periods of drought or extended heat. It is not particular as to soil type or pH. It is somewhat tolerant of urban pollution. Consider applying a thick mulch around the root zone in both summer and winter to conserve soil moisture and protect it in exposed locations or colder microclimates. This species is not originally from North America. It can be propagated by division.
